EDUCATION

York University

Toronto, Ontario, Canada

Bachelor of Science – Computer Science

Sept 2019 – Apr 2024

SKILLS & ABILITIES

AI/LLM: Agents, MCP, Claude Agent SDK, Evals (grounded, state-based), Token cost attribution, Prompt and Context design

Programming: TypeScript, JavaScript, Ruby, SQL, Java

Frameworks & Libraries: React, Redux, Ruby on Rails, Node.js, Express.js, Angular, NgRx, React Native, Spring Boot, Jest

Infra and data: PostgreSQL, Redis, AWS (EC2, RDS, S3), Sentry, Datadog, Git

EXPERIENCE

Homebase

Software Engineer II (*React, Ruby on Rails, Redux, PostgreSQL*)

Sept 2026 – CURRENT

Software Engineer

May 2025 – Aug 2026

- Built the interactive canvas and supporting APIs for Schedule Builder Agent, an AI scheduling assistant live across 500+ locations.
- Designed and built a tool-calling LLM agent that drives the web app through 10+ concurrent multi-step workflows, generating production-like data.
- Developed an automated eval harness verifying runs against real app data, measuring a 95% verified success rate and catching failures the agent falsely reported as successes.
- Drove a 76% cut in cost per task by instrumenting LLM observability for token cost, latency, and run-time metrics, informing a data-backed cost-viability decision.
- Saved ~\$20K/month in third-party seat costs with a scheduled worker that auto-downgrades inactive users.
- Shipped an LLM ticket-writing tool to 117 engineers; moved my team to spec-driven development.
- Migrated Schedule Builder's Rails API off Grape, removing auth conflicts; fixed 3 broken-access-control vulnerabilities.
- Re-architected drag-and-drop into a shared provider and reusable hooks, adopted across 5 teams and unblocking AI feature work.
- Reduced worst-case load times from 11s to under 1s by refactoring 9 core frontend modules into modular TypeScript files.

Candoor

Software Engineer (*AWS, SQL, Laravel*)

Oct 2024 – Mar 2025

- Separated a monolithic application by deploying AWS services (EC2, RDS, S3) boosting system reliability by 30%.
- Implemented Microservices and MVC design patterns for a modular and scalable architecture, reducing development time by 30%

Bank of Montreal

Software Developer Intern (*Angular, TypeScript, Jest, C#, .NET*)

Sept 2022 – Dec 2023

- Conducted unit tests with Jest resulting in a test coverage increase of 70% along with the resolution of 100+ bugs.
- Implemented automated TypeScript functions: CSV to JSON/JSON to CSV converters and translation gap identifiers for EN/FR assets to reduce manual workload by 50%.

PROJECTS

BiteSpot, Food Discovery App (*React Native, TypeScript, Java, SpringBoot*)

- Engineered a multi-layer caching system for search, video, and location data, reducing load times by 40% and API calls by 65%.
- Eliminated expensive scroll-based rendering, resulting in a 73% reduction in company costs.
- Leveraged feedback from 3500+ beta impressions into Agile-driven releases, significantly improving UI/UX performance.
